New dengue virus-specific primers, useful for reverse transcriptase-polymerase chain reaction assays, particularly for detecting or quantitating dengue virus in a sample. WPI; 2003-182625/18.

Claim 28; Page 1; 6pp; English.

This invention relates to novel Dengue virus reverse transcriptase (RT) PCR primers which may be used to detect Dengue virus in a sample. Dengue virus is a member of the flavivirus family and causes diseases including dengue fever (DF) and dengue haemorrhagic fever. The invention also

```
The invention discloses a pharmaceutical composition capable of inducing an immune response in a mammalian subject, comprising an immunogenic an immune response in a mammalian subject, comprising an immunogenic amount of a eukaryotic plasmid expression vector in pharmaceutical form, which includes the envelope and membrane (PreM) genes of a dengue type 1, 2, 3, or 4 virus. Dengue virus (Den) belongs to the flavivirus genus of the family Flaviviridae and is a positive strand RNA virus encoding ten proteins. These genes are translated as a polyprotein which is cleaved by host and viral proteinases. The virus envelope protein is a major antigen which can be targeted by neutralising antibodies. The membrane protein also appears on the virion surface and is required for proper processing of the envelope protein. Dengue virtuses are transmitted primarily by the mosquito, Aedes aegyptii, and can lead to human illnesses ranging from coute undifferentiated fever to dengue haemorrhagic fever (DHF) and dengue shock syndrome (DSS). Secondary infections, with a different service to the invention are DNA vaccines which are injected into the animal as a
                                                                                                                                                                                                                            ö
comprises a method for detecting and quantitating dengue virus. The dengue virus-specific primers of the invention are useful in reverse transcriptase-polymerase chain reaction assays, particularly for detecting or quantitating dengue virus in a sample. The present sequence represents a dengue virus specific RT-PCR primer used in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New pharmaceutical compositions containing dengue nucleic acids, useful as a vaccine, particularly for inducing a protective immune response in mammalian subjects against the dengue virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pharmaceutical; ds; immune response; immunogenic; envelope; membrane; PreM; dengue virus; Den; serotype; flavivirus; Flaviviridae; antigen; mosquito; Aedes aegyptii; acute undifferentiated fever; dengue haemorrhagic fever; DHF; dengue shock syndrome; DSS; immune enhancement phenomenon; DNA vaccine; gene therapy; vaccine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        tetravalent and containing a common nucleotide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4. The invention may be useful for the development of compounds with a vircide or immunostimulant activity or as a vaccine. The tetravalent vaccine is useful in the prevention of disease in humans caused by dengue virus. Unlike previous tetravalent vaccine, the new tetravalent vaccine is unique since they contain a common shared attenuating mutation which subject to be vaccinated since each component of the vaccine possesses the same deltail attenuating deletion mutation. The vaccine also is able 1structural proteins present in each dengue virus serotype. The present sequence is that of the DENI ME chimeric region DNA which is related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               immunogenic composition; dengue type 1; dengue type 2; dengue type 3; dengue type 4; virucide; immunostimulant; vaccine; tetravalent vaccine; dengue virus; deltalo; attenuating mutation; humoral response; cellular response; non-structural protein; structural protein; dengue virus serotype; gene; ds; plasmid P2.
technique of gene therapy. The composition is useful as a vaccine, particularly for inducing a protective immune response in mammalian subjects against the dengue virus infection. The sequence presented is

This cDNA sequence encodes the capsid, prM, envelope (E) and NS1 proteins (see AAV05522) of serotype 2 dengue virus DEN-2 strain PR159/S1. This strain served as the source for DEN-2 genes used in the invention. A vaccine for protecting against flavivirus infection comprises a dimeric content that has been secreted as a recombinant protein from a second interpretation of a limitation of a copies of 80% E indicates a C-terminally truncated flavivirus E. The dimeric truncated E is formed: (1) by directly linking 2 tandem copies of 80% E via a flaxible tether; (2) via the formation of a leucine zipper domain through the homodimeric association of 2 leucine zipper of a linking of an 80% E molecule; or (3) via the formation of a non-covalently associated four-helix bundle domain formed upon association of two helix-turn-helix moieties attached to the C-terminus of an 80% E molecule. Dimeric truncated DNL-2 E proteins are efficiently secreted by recombinant cells, are easier to purify than intracellular proteins, and generate a high titer neutralising antibody cresponse. The method is generally applicable to flaviviruses, in particular dengue viruses such as DEN-2, where 80% E comprises amino acids 1-395 of DEN-2 E. The products can also be used for diagnosis of infection. (Updated on 17-0CT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          neutralising antibody response to a Flavivirus in a murine host. The vaccine comprises a therapeutic amount of a dimeric 80%E, the dimeric 80%E having been secreted as a recombinantly produced protein from Drosophila Schneider cells, and where 80%E represents the N-terminal 80% portion of the protein from residues 1-395. Also described are: an immunogenic polypeptide comprising the dimeric 80%E cited above; an immunogenic composition that generates a protective, neutralising antibody response to a Flavivirus in a murine host, comprising the above immunogenic polypeptide and a physiological carrier; a multivalent immunodiagnostic for the detection of Flavivirus, comprising at least 2 of the above immunogenic polypeptides of at least 2 flaviviral serotypes; and immunodiagnostic kit for the detection of Flavivirus in a test onlycetic composition the above immunogenic or multivalent immunodiagnostic composition is useful for preventing or diagnostic 80%E, and labeled antibodies immunocractive to antibodies from the test subject. The composition is useful for preventing or diagnosing infections caused by dengue virus. This sequence encodes Dengue virus gene viral capaid, prM, E and NSI genes for Dengue virus strain PRIS9/SI used as the source

The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated nonstructural genes of the virus are used as a backbone into which the structural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of .viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses are also used as immunogenic flavivirus chimeras are also used as immunogenic flavivirus chimeras are also used as immunogenic flavivirus chimeras. Den and ENN-4. Immunogenic flavivirus chimeras benchose virus types 1-4 (DEN-1) confer simultaneous protection against infections. The present cDNA sequence encodes wild-type, virulent dengue-4 (DEN-4) 1036 virus protein conferucting flavivirus chimeras. Denneue virus types 1-4 (DEN-1) conferucting flavivirus chimeras. Denneue virus types 1-4 (DEN-1) conferucting flavivirus chimeras. Denneue virus types 1-4 (DEN-1) conferucting region followed by a capsid protein (C) encoding region, premembrane/membrane protein (E) encoding region, followed by the region encoding noncoding region. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Flavivirus, Dengue virus-4, DEN-4, vaccine; infection; virucidal; mutein; avirulent; immunogenic; viral disease; pharmaceutical; mutant; variant;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                    Chimeric flaviviruses that are avirulent and immunogenic, useful for vaccinating against a range of dengue viruses.

                    Key
    The invention Flates to avituant, imminogenic liavivitus cnimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses alicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flavivirus confer simultaneous protection against infections. The present CDNA sequence encodes attenuated dengue 4 (DEN-4) PDK-48 virus protein variant used for constructing flavivirus chimeras. Dengue virus types 1-4 (DEN-1) to DEN-4) are mosquito-borne flavivirus pathogens. The flavivirus genome contains 5' non-coding region followed by a capsid protein (C) encoding region, premembrane/membrane protein (prM) encoding region, an envelope protein (E) encoding region. (Dalowed by the region encoding non-coding region. DEN-4 virus passaged in primary dog kidney (PDK) cells times is designated as DEN-4 PDK-48 virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                    Chimeric flaviviruses that are avirulent and immunogenic, useful for vaccinating against a range of dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

"NS4B protein"

```
New mutated flavivirus, useful for fine tuning the attenuation and growth characteristics of dengue virus vaccines for the prevention and/or treatment of dengue virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to novel mutated flaviviruses comprising a phenotype in which the viral genome is modified by introduction of a mutation, singly or in combination, taken from mutations from recombinant virus bearing Vero adaptation mutations, putative Vero call adaptation mutations of dengue type 4 virus (DEN4) or mutations known to attenuate dengue type 4 virus. The methods and compositions of the invention are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; Page 131-132; 246pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to novel mutated flaviviruses comprising a phenotype in which the viral genome is modified by introduction of a mutation, singly or in combination, taken from mutations from recombinant virus bearing Vero adaptation mutations, putative Vero cell adaptation mutations of dengue type 4 virus (DEN4) or mutations of the invention are useful for fine tuning the attenuation and growth characteristics of dengue virus vaccines for the prevention and/or treatment of dengue virus infection. The present sequence is Dengue virus type 4 strain 2A DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Flavivirus; Dengue virus; DEN; vaccine; infection; virucidal; avirulent; immunogenic; viral disease; pharmaceutical; chimeric, ss.

                                                                                                                                                 The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated nonstructural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric cimpanying clinical symptoms of viral disease. Attenuated chimeric cimpanians are also used as immunogenic flaviviruses such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA sequence encodes dengue virus (DEN)-2/3-VPI fusion protein related to the invention. This fusion protein contains attenuated DEN-2 pEN-33V backbone comprising a valine at the non-structural protein (NS)-250 and the premembrane/membrane protein (prM) and an envelope protein (E) from wildtype DEN-3 16562 virus. ```
Detection and identification of Flaviviridae in biological sample - by amplifying consensus sequence then hybridisation opt. followed by typing, e.g. sequencing amplified prod.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The dengue 2 virus is an example of a member of the Flaviviridae which can be identified using the probe pair of the invention. A species-specific sequence can be amplified using the claimed oligonucleotides as primers in a PCR reaction (see AAQ12788 and AAQ12789). Other viruses which can be identified include Japanese encephalitis virus and yellow fever virus. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Dengue 2 virus; polyprotein; capsid; prM; M; E; NS1; NS2B; NS2B; NS3; NS4A; NS2B; PDK-253; quadravalent vaccine; immunity; seroctype; chimeric DEN-2/1 virus; chimeric DEN-2/3 virus; chimeric DEN-2/4 virus; dengue fever; fatal dengue haemorrhagic fever; dengue shock syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 10723 BP; 3557 A; 2251 C; 2647 G; 3 T; 2249 U; 16 Other;

                                                                                                                                                                                                                                                                                                                               This sequence encodes the polyprotein from Dengue 2 virus, strain 16681. The polyprotein comprises the capsid, prM, M, E, NS1, NS2A, NS2B, NS3, NS4A, NS4B, and NS5 proteins. A clone of this wildtype viral sequence, PDK -53, may be used in the production of a quadravalent vaccine which provides immunity against all four serotypes of dengue virus. The vaccine also comprises a chimeric DEN-2/1 virus, a chimeric DEN-2/3 virus, and/or achimeric DEN-2/4 virus. The new quadravalent vaccines are used to protect against infection by all four serotypes of dengue virus, DEN-1, DEN-2, DEN-3 and DEN-4, which can lead to dengue fever or fatal dengue haemorrhagic fever/dengue shock syndrome (DHF/DSS). Host cells are used
                                                                                                                                                                                                                                                                                                                                                                                                                                             to produce the recombinant protein products of the DNA constructs which are used in the vaccines. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Dengue 2 virus; polyprotein; capsid; prM; M; E; NS1; NS2B; NS2B; NS3; NS4B, NS 40; NS4B; NS5; PDK-23; quadravalent vaccine; immunity; serotype; chimeric DEN-2/3 virus; chimeric DEN-2/4 virus; dengue fever; fatal dengue haemorrhagic fever; dengue shock syndrome;

This sequence encodes the polyprotein from an attenuated derivative of Dengue 2 virus, strain 16681. The derivative is designated PDK-53. The Polyprotein comprises the capsid, prM, M, E, NB1, NS2A, NS2B, NS3, NSAA, NS4B and NS5 proteins. The PDK-53 viral sequence may be used in the production of a quadravalent vaccine which provides immunity against all four serotypes of dengue virus. The vaccine also comprises a chimeric DEN-2/1 virus, a chimeric DEN-2/3 virus, and/or a chimeric DEN-2/3 virus, and/or a chimeric DEN-2/3 virus, and/or a chimeric DEN-2/3 virus, and DEN-2/4 virus, and chimeric DEN-2/3 virus, and chimeric DEN-2/4 virus, and comprises of dengue virus, DEN-1, DEN-2, DEN-3 and DEN-4, which can lead to dengue fever or fatal dengue haemorrhagic fever/dengue shock syndrome (DHF/DSS). Host cells are used to produce the recombinant products of the DNA constructs which are used in the vaccines. (Updated on 27-AUG-2003 to correct OS field.)

The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural genes of the virus are used as a backbone into which the etructural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA captence encodes dengue virus (DEN)-2,1-VP1 fusion protein related to the invention. This fusion protein contains attenuated DEN-2 DEN-53V backbone companyising a valine at the non-structural protein (NS3)-250 and the premembrane membrane protein (prA) and an envelope protein (B) from wild-type DEN-1 16007 virus. (Updated on 11-SEP-2003 to standardise OS field)

The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural genes of the virus are used as a backbone into which the structural genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses unch as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogens cuch as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogens to confer simultaneous protection against infections. The present cDNA sequence encodes wild-type, virulent dengue-2 (DEN-2) 16681 virus protein used for constructing flavivirus chimeras. Dengue virus types 1-4 (DEN-1) confers on non-coding region followed by a capsid protein (C) encoding region, premembrane/membrane protein (pwW) encoding region, followed by a capsid protein (C) encoding region, followed by the region encoding non-coding region. (C) lowed by the region encoding non-coding region. (C) lowed by the region encoding non-coding region. (L) sep-2003 to standardise OS field)

                                                                                                               원
                                                                                                                                                                                                                 The invention relates to avirulent, immunogenic flavivirus chimeras

Comprising amino acid mutations in the non-structural proteins of a

Lavivirus. Chimeric viruses containing the attenuation-mutated non-
structural genes of the virus are used as a backbone into which the
structural protein genes of a second flavivirus strain are inserted.

These chimeric viruses elicit pronounced immunogenicity but lack the
accompanying clinical symptoms of viral disease. Attenuated chimeric
flaviviruses are combined in a pharmaceutical composition to confer
simultaneous immunity against several strains of pathogenic flaviviruses
such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic
flavivirus chimeras are also used as immunogens or multivalent vaccines
to confer simultaneous protection against infections. The present cDNA
sequence encodes dengue virus (DEN)-2/4-VP1 fusion protein related to the
invention. This fusion protein contains attenuated DEN-2 packbone
comprising a valine at the non-structural protein (BN3)-250 and the
premembrane/membrane protein (PrM) and an envelope protein (B) from wild-
type DEN-4 1036 virus. (Updated on 11-SEP-2003 to standardise OS field)

structural protein genes of a second flavivirus strain are inserted.

These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA sequence encodes attenuated dengue-2 (DEN-2) PDK-53 virus protein variant used for constructing flavivirus chimeras. Dengue virus spotein variant to DEN-4) are mosquito-borne flavivirus pathogens. The flavivirus genome contains 5, non-coding region followed by a capsid protein (C) encoding region, premembrane/membrane protein (prM) encoding region, an envelope protein (E) encoding region, followed by the region encoding non-contains (NSI-NS2A-NS3-NS4A-NS4B-NS5) and finally a 3'
                                                                                                                                                                                                                                                                                                                                                                                                                                                          ..

The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated nonstructural genes of the virus are used as a backbone into which the structural genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA sequence encodes dengue virus (DEN)-2/MN-PPI fusion protein related to the invention. This fusion protein contains DEN-2 16681 backbone and the premembrane membrane protein (prM) and an envelope protein (E) from West nile NY99. (Updated on 06-AUG-2003 to correct OS field.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a novel immunogenic composition being tetravalent and containing a common nuclectide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4. The invention may be useful for the development of compounds with a virucide or immunostimulant activity or as a vaccine. The tetravalent vaccine is useful in the prevention of disease in humans caused by dengue virus. Unlike previous tetravalent vaccine, the new tetravalent vaccine is unique since they contain a common shared attenuating mutation which eliminates the possibility of generating a virulent wild type virus in subject to be vaccinating deletion mutation. The vaccine also is able the same delta30 attenuating deletion mutation. The vaccine also is able to induce humoral and cellular responses against al of the (non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New tetravalent vaccine containing a common nucleotide deletion in the 3'

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            tetravalent and containing a common nucleotide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4. The invention may be useful for the development of compounds with a vircide or immunostimulant activity or as a vaccine. The tetravalent vaccine is useful in the prevention of disease in humans caused by dengue virus. Unlike previous tetravalent vaccine, the new tetravalent vaccine is unique since they contain a common shared attenuating mutation which eliminates the possibility of generating a virulent wild type virus in a subject to be vaccined since each component of the vaccine possesses the same delta30 attenuating deletion mutation. The vaccine also is able to induce humoral and cellular responses against al of the (non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   )structural proteins present in each dengue virus serotype. The present sequence is that of the DEN1 CME chimeric region DNA which is related to

```
DENI virus, strain S275/90 was isolated from the serum of a dengue haemorrhagic fewer (DHP) patient. RNA was isolated from the virus and used to prepare cDNA encoding DENI polypetides. Dengue Virus 17pe 1 prods. can be used for detection, diagnosis, vaccines (inactivated form) or treatment of DENI infections. The sequences given in AAQS1477-86 are oligonucleotides used to prepare CDNA fragments corresp. to Dengue virus proteins, by PCR. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                 Flavivirus; Dengue virus; DEN; vaccine; infection; virucidal; avirulent; immunogenic; viral disease; pharmaceutical; chimeric; ss.
                                        New Dengue virus type 1 strain – used to obtain prods. for detection, diagnosis, vaccines and treatment involving virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to avirulent, immunogenic flavivirus chimeras
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chimeric flaviviruses that are avirulent and immunogenic, useful vaccinating against a range of dengue viruses.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           THE LITTLE LITTL
comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural protein genes of a scond flavivirus strain are inserted.

These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmacutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses used as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA sequence encodes dengue virus (DEN)-2/1-VP fusion protein related to the invention. This fusion protein contains attenuated DEN-2 PDK-53V backbone comprising a valine at the non-structural protein (RS3)-250 and the capsid protein (C), premembrane/membrane protein (UNS3)-250 and the capsid protein (E) from wild-type DEN-1 16007 virus. comprising unaction in the account of the accompanying clinical symptoms of viral disease. Attenuated chimeric accompanying clinical symptoms of viral disease. Attenuated chimeric almunithments are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA sequence encodes dengue virus (DEN-1, VEN-3) and DEN-2. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA sequence encodes dengue virus (DEN-1, VE fusion protein related to the invention. This fusion protein contains attenuated DEN-2 PDK-53V backbone comprising a valine at the non-structural protein (NS3)-250 and the capsid protein (C), premembrane/membrane protein (DEN-1) PDK-13 virus. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Flavivirus; Dengue virus-1; DEN-1; vaccine; infection; virucidal; mutein; avirulent; immunogenic; viral disease; pharmaceutical; mutant; variant;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus serocypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA sequence encodes attenuated dengue-1 (DEN-1) PDK-13 virus protein variant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     used for constructing flavivirus chimeras. Dengue virus types 1-4 (DEN-1 to DEN-4) are mosquito-borne flavivirus pathogens. The flavivirus genome contains 5' non-coding region followed by a capsid protein (C) encoding region, premembrane/membrane protein (prM) encoding region, an envelope protein (E) encoding region, followed by the region encoding non-structural proteins (NSI-NS2A-NS2A-NS3A-NS4A-NS4B-NS5) and finally a 3'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present sequence was used in an invention relating to novel compositions and methods containing tetracycline or tetracycline-like compositions and methods containing tetracycline or tetracycline-like compounds for treating and/or preventing acute inflammatory responses and diseases. Such diseases include acute inflammatory conditions associated with viral haemorrhagic diseases (including diseases caused by Bunyaviridea, Filoviridae, Flaviviridae or Arenaviridae viruses), parasitic diseases, bacterial infections, sepsis, cachexia, autoimmune disorders, acute cardiovascular events, chronic myelogenous leukaemia and transplanted bone marrow-induced graft-versus-host disease, septic shock, immune complex-induced collitis, cerebrospinal fluid inflammatin, multiple sclerosis, inflammatory responses associated with trauma, expense, inflammatory response syndrome (SIRS), adult respiratory distraces syndrome (ARDS), acute liver failure, inflammatory bowel disease
                                                                 Novel compositions comprising tetracycline or tetracycline-like compounds for the treatment and/or prevention of acute inflammatory responses and diseases, e.g. septic shock and immune complex-induced colitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Dengue 2 virus; polyprotein; capsid; prW; M; E; NS1; NS2A; NS2B; NS3; NS4A; NS4B; NS5; PDK-53; quadravalent vaccine; immunity; serotype; chimeric DEN-2/1 virus; othimeric DEN-2/3 virus; chimeric DEN-2/4 virus; dengue fever; fatal dengue haemorrhagic fever; dengue shock syndrome; DHF; DSS; PCR; amplify; polymerase chain reaction; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                      New diagnostic kit comprising West Nile Virus (WNV) envelope protein reactive with antibody against WNV and cross-reactive with antibody against a flavivirus, useful in diagnosing flavivirus infection caused by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a diagnostic kit comprising at least one isolated and purified polypeptide comprising a West Nile Virus (WNV) envelope (E) protein or its immunogenic fragment having a native conformation or non-denatured structure and that is reactive with antibodies against WNV and cross-reactive with antibodies against a flavivirus. The diagnostic kit is useful in diagnosing flavivirus infection caused by DENV, WNV, JEV or SLEV. This sequence corresponds to the complete nucleotide sequence of the DENV isolate WestPac.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Dengue virus; antiinflammatory; haemostatic; antibacterial; sepsis; immunosuppressive; immunomodulator; cardiant; cytostatic; cachexia; neuroprotective; respiratory; inflammation; infection; Crohn's disease; multiple sclerosis; autoimnune disorder; cardiovascular disorder; chronic myelogenous leukaemia; inflammatory bowel disease; PCR primer;

                   The sequences given in AAT75909-T76029 are primers which were used in the amplification, cloning and sequencing of the Dengue-2 viral CDNA's of the invention. The Dengue 2 viral DNA encodes a polyprotein which comprises the capsid, prM, M, E, NSI, NS2A, NS2B, NS3, NS4A, NS4B and NS5 proteins. The quadravalent vaccine of the invention comprises an attenuated Dengue virus clone, PDK-53, and a chimeric DEN-2/1 virus, a chimeric DEN-2/3 virus. The new quadravalent vaccines are used to protect against infection by all four serceypes of dengue virus, DEN-1, DEN-2, DEN-3 and DEN-4, which can lead to dengue fever or fatal dengue haemorrhagic fever/dengue shock syndrome (DHF/DSS). Host calls are used to produce the recombinant protein products of the DNA constructs
                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Chimeric flaviviruses that are avirulent and immunogenic, useful for vaccinating against a range of dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               z

                                                                                                 flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present CDNA sequence encodes wild-type, virulent dengue-3 (DEN-3) 16562 virus protein used for constructing flavivirus chimeras Dengue virus types 1-4 (DEN-1) to DEN-4) are mosquito-borne flavivirus pathogens. The flavivirus genome contains 5' non-coding region followed by a capsid protein (C) encoding region, premembrane protein (pww) encoding region, an envelope protein (E) encoding region, followed by the region encoding non-structural proteins (NSI-NSZA-NSZA-NSZA-NSSA-NSS) and finally a 3' non-coding region. (Updated on 11-SEP-2003 to standardise OS field)
accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Dengue virus-3; DEN-3; vaccine; infection; virucidal; mutein; immunogenic; viral disease; pharmaceutical; mutant; variant;

                                                                                                                                                             The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines confer simultaneous protection against infections. The present cDNA sequence encodes attenuated dengue-3 (DEN-3) PCNK-13/PRhL-3 (30 passages in primary green monkey kidney (PGMK) cells, followed by 3 passages in foetus rhesus lung cells) virus protein variant used for constructing flavivirus chimeras. Dengue virus types 14 (DEN-1 to DEN-4) are mosquito borne flavivirus pathogens. The flavivirus genome contains 5 non-coding region, and and an expession of the modeling region, and and an expession of the modeling region, and an expession of the modeling region of the modeling of the modeling region of the modeling of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               premembrane/membrane protein (prM) encoding region, an envelope protein (E) encoding region, followed by the region encoding non-structural proteins (NS1-NS2A-NS2A-NS3-NS4A-NS4B-NS5) and finally a 3' non-coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     immunogenic composition; dengue type 1; dengue type 2; dengue type 3; dengue type 4, viracide; immunostimulant; vaccine; terravalent vaccine; dengue virus; delta30; attenuating mutation; humoral response; cellular response; non-structural protein; structural protein;

                                                                                                                                                                          New tetravalent vaccine containing a common nucleotide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4, useful for preventing of disease in humans caused by dengue virus, or for inducing immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                     tetravalent and containing a common nucleotide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4. The invention may be useful for the development of compounds with a virucide or immunostimulant activity or as a vaccine. The tetravalent vaccine is useful in the prevention of disease in humans caused by dengue virus. Unlike previous tetravalent vaccine, the new tetravalent vaccine is unique since they contain a common flared attenuating mutation which eliminates the possibility of generating a virulent wild type virus in subject to be vaccinated since each component of the vaccine spossesses the same delta30 attenuating deletion mutation. The vaccine also is able to induce humoral and cellular responses against al of the (non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Replicon; structural region; vaccine; subgenomic replicon; gene therapy; structural protein; C protein; PreM protein; E protein; immunisation; GFP; green fluorescent protein; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New subgenomic replicon of dengue virus origin comprising a deletion for
the sequence coding for C, PreM and/or E structural proteins, useful as
vaccines for immunization against dengue virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              )structural proteins present in each dengue virus serotype. The present sequence is that of the DEN3 cDNA plasmid P3 which is related to the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              21-JUN-12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9-JUN-1
 This invention describes a novel subgenomic replicon of dengue virus origin comprising a deletion for the sequence coding for C, Prew and E (DeltacME), for Prew and E (DeltamE), or for E (DeltaE) structural proteins, and/or which is adapted to receive at least a nucleotide sequence without disrupting its replication capabilities. The products of the invention can be used for constructing (1) a vaccine or a therapeutic comprising the subgenomic replicon and a carrier; (2) a dengue virus-like particle comprising the subgenomic replicon, and structural proteins of the homologous dengue virus, which encapsulates the subgenomic replicon, and (3) methods of immunisation and treatment comprising administering to the individual the subgenomic replicon or the dengue virus like particle cited above. The subgenomic replicons are useful in gene therapy as cited above. The subgenomic replicons are useful in gene therapy as vaccines for immunisation against dengue virus infection. This sequence represents a PCR primer used with ARP88817 to amplify the green fluorescent protein (GFP) gene cloned into the dengue virus deltapre-M/E replicon, at the site previously occupied by the pre-M/E genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hybridisation assay; genetic mapping; gene expression control; protein identification; signal transduction pathway; metabolic pathway; promoter; termination sequence; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a strand specific amplification method which comprises: (a) determining nucleic acid sequences of a target nucleic acid strand; (b) designing a convertible oligonucleotide based, at least in part, on the target nucleic acid strand; (c) conducting a transcription reaction utilising the convertible oligonucleotide and the target nucleic acid strand to proved at least one resultant complementary strand; (d) conducting an amplification reaction to amplify the at least one resultant complementary strand; and (e) analysing the amplification reaction. Also described: (1) a convertible oligonucleotide comprising a first self-annealing portion and a second portion complementary, at least in part, to a target nucleic as second portion complementary, at least conformational chimeric nucleotides and hemi-nested primers. The method is useful for strand specific amplification. The method is useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ő

Oligonucleotide for detecting cytosine methylation SEQ ID NO 20593.

```
Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used:

(i) for diagnosis and/or prognosis of side effects of therapeutic drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of call or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ```

methylation of aparticular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligometelectides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP'S); and (1) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously, ABO13410-SME05421 represent genomic DNA sequences used to illustrate the method for disclosure of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more
genes from Drosophila and for elucidating cell signaling and cell-cell

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and insell-cell interactions in higher elevaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Neisseria meningitidis; Neisseria gonorrheae; genome; immunogenic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                                                                                   The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81451 to AAA82414 represent specifically claimed Neisseria meningitidis genomic DNA sequences. AAA81260 to AAB2560 to AAB2563 represent Neisseria DNA sequences and their corresponding proteins; AAA81264 to AAA81259 and AAA8121 represent PCR primers used in the isolation of Neisseria meningitidis DNA sequences, and AAA81322 to AAA8132 represent Neisseria meningitidis Menb polymucleotide ORF sequences, which are all Neisseria meningitidis Menb polymucleotide ORF sequences, which are all cased in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition. The composition can be used as a medicament (or in the manufacture of a medicament) for treating, preventing or diagnosition discrement (or in the manufacture of a medicament of against all services and/or against all services. Seample, some of the identification of sequences from the bacterium canner production of biological probes, particularly probes. Attempts to make efficacious Meningococcus B capinst all services of sequences from the bacterium call also facilitate production of sequences from the bacterium called an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than other more variable regions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                         Isolated nucleotide sequences of Neisseria meningitidis which can be used in the diagnosis and treatment of N. meningitidis infection and other Neisserial infections, for example, N.gonorrhoea.

```
The present sequence encodes a green pepper fatty acid 13-hydroperoxide lyase (13-HPOL). The specification describes guava 13-HPOLs, which contain a unique region (see AAY53763) that is not present in green pepper or banana 13-HPOLs A recombinant 13-HPOL can be used to cleave a 13-hydroperoxide of linoleic or alpha-linoleic acid into a G6-aldehyde and a C12-oxocarboxylic acid. The 13-HPOL can also be used to prepare n-hexanal, 3-(2)-hexan-1-al, or their corresponding alcohols from 13-hydroperoxy-octadeca-9,11-dianoic acid or 13-hydroperoxy-octadeca-9,11-dianoic acid or 13-hydroperoxy-octadeca-9,11-dianoic acid or 13-hydroperoxy octadeca-9,11-dianoic acid octadeca-9,11-dianoic acid or 13-hydroperoxy octadeca-9,11-dianoic acid or 13-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Recombinant guava fatty acid 13-hydroperoxide lyase, used in, e.g. fruit

```
The invention relates to a novel transformed plant in which a hydroperoxide lyase (HPL) gene coding for a volatile biosynthesis HPL cargyme is transduced in the sense/antisense direction, where activity of the HPL enzyme is improved or reduced compared to wild-type plant. The cinvention further relates an insect-extermination method using the transformed plant. In the transformed plant, the HPL gene is transduced in the transformed plant, the HPL gene is transduced in the specification, and is derived from green pepper. The HPL gene transduced in the antisense direction has a fully defined sequence of 1147 base spairs as given in the specification, and is derived from green pepper. The HPL gene transduced in the antisense direction has a fully defined from Arabidopsis thaliana. The blosynthesis of an isothiocyanate compound is promoted in the transformed plant compared to the wild-type plant. The transformed plant is a Brassicaceae plant such as A. thaliana. The transformed plant efficiently exterminates an insect pest and also effectively inhibits growth of an insect pest. The novel transformed plant reduces the usage of an agrochemical. This polynucleotide sequence transeauts the 1647bp HPL gene from a green pepper of the invention.
A transformed plant in which hydroperoxide lyase gene coding for volatile biosynthesis hydroperoxide lyase is transduced in sense or antisense direction, useful in insect-extermination.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Recombinant pox-virus e.g. vaccinia, fowl-pox and canary-pox virus -contg. DNA from flavi-virus e.g. Japanese encephalitis and yellow fever virus, used as vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Japanese Encephalitis Virus; vaccinia virus donor; plasmid pDr20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                    Cleaving 13-hydroperoxide of linoleic acid into aldehyde and oxocarboxylic acid, and preparing n-hexanal from 13-hydroperoxy-octadeca-9,11-dienoic acid, using recombinant fatty acid 13-hydroperoxide lyase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a method of cleaving 13-hydroperoxide (1) of linoleic or alpha-linolenic acid into 6C-aldehyde (A) and 12C-oxocarboxylic acid (B). The method involves the use of recombinant protein produced by a vector containing nucleic acid encoding fatty acid 13-hydroperoxide of linoleic or alpha-linolenic acid into a 6C-aldehyde and a 12C-oxocarboxylic acid, and for preparing n-hexanal, 3-(2)-hexan-1-al, 6C-aldehyde, 12C-oxocarboxylic acid, or their corresponding alcohols from 13-hydroperoxy-octadeca-9,11.15-trienoic acid. This sequence sequence encodes green pepper 13-hydroperoxide lyase (13-HPOL)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       transformed; transgenic plant; hydroperoxide lyase; HPL; volatile biosynthesis HPL enzyme; insect; extermination; isothiocyanate; agrochemical; gene; green pepper; ds.

cDNA was prepared from genomic virion RNA obtained from suspension cultures of C6/36 cells infected with a passage 55 suckling mouse brain stock of the Nagayama strain of JEV. EcoR1 linkers were ligated to the CDNA fragments for cloning into DBR332. Recombinant plasmids were transformed into E.coli DHS cells. Plasmid pC20 contained 81 non-coding nuclectides and the coding regions for C and prW. Sequence AAQ22767 is that of the C coding region of pC20, combined with an updated sequence of the prW, E, NS1, NS2A and NS2B coding regions of the Nagayama strain. The sequence begins at the C protein Met initiation codon. A subfragment of pC20 was cloned into pUC18 to give pDr20. This plasmid was then used in the construction of novel recombinants JEV24, JEV27, JEV33 and JEV34. These were transfected into vP410 infected cells to generate vP825, vP829, vP857 and vP864, respectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (NTR) and a single polypeptide coding region. The JEV genomic RNA, JEV cDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New Japanese encephalitis virus genomic RNA, useful in developing vaccines for and in diagnosing and treating Japanese encephalitis.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Description

NUMBER OF SEQUENCES: 50
COMPUTER READBLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PATEBLIT Release #1.0, Version #1.30 (EPO)
CURRENT APPLICATION DATA:
APPLICATION NUMBER: PCT/US96/07627
INFORMATION FOR SEQ ID NO: 2:
SEQUENCE CHARACTERISTICS:
LENGTH: 3381 base pairs
TYPE: nucleic acid
STAMDEDNESS: single
